IDENTIFYING MULTILINGUAL PARTICIPANTS IN NETWORK COMMUNICATIONS

Abstract of the Disclosure

An ad hoc wireless network may facilitate

5   identification of participants whose personal computers or other devices utilize an incompatible character set. Thus, users with incompatible character sets may not be identified on display screens associated with the various participants in a compatible character set that may be

10   understood by all participants. Thus, other identifying information may be provided and may be displayed automatically or on demand. Examples of such identifying information include identifying icons, audio files and image files.
